

Setup IMAP e-mail on Android

Remember that, if you have an Enhanced account, you can [use ActiveSync](#), to not only sync e-mails, but also contacts and events.

Here's the step by step for setting up an IMAP account on Android's native mail app.

- Press the device's **Menu** button.
- Tap **Settings**.
- Click on **Accounts**
- Click on **Add account**.
- Click on **Email**.
- Enter your full e-mail address and password.
- Select if you want to send e-mails using this account by default
- Click on Next
- Click **Manual setup**.
- In account type, choose **IMAP account**.
- Android will automatically use `imap.yourdomain.com` and `smtp.yourdomain.com` as hosts, which is OK
- Username field has to be changed to your **FULL** e-mail address
- Click on Next 3 times in a row, note that on the last page you can setup specific details such as interval for checking mail
- On the last page, Android gives you the option to change the friendly name and also Your name, as it appears to recipients.
- Click on OK to finalize the procedure.

If you want to setup IMAP with SSL, after clicking on **Add account > Email** and typing in your e-mail and password, fill out the hostnames as per below.

- IMAP server - `imap.emailarray.com`
- Security type - SSL or SSL/TLS
- Port 993
- SMTP Server - `smtp.emailarray.com`
- Security type - SSL or SSL/TLS
- Port - 465

Note that IMAP is preferred over POP. If you want to set up the account as POP, you have to set it up manually. IMAP is a protocol made to support several devices accessing one same account, with all folders synced at our server, which also guarantees that our backups will be executed.
